Comment: Wood Duck is new to the Birmingham count, the 118th species recorded in 23 years. At Dauphin the following species are recorded for the first time in winter in Alabama: Reddish Egret, Chuck-will's-widow, Knot, and Parula Warbler; and the following have been recorded in Alabama in winter on the coast less than 8 times: Common Scoter, Common Merganser, Osprey, Rough-winged Swallow, and Black-and-white Warbler. These two counts constitute the 85th and 86th Alabama Christmas Counts that have been published in Bird-Lore and its successors.

NASAL MITES IN ALABAMA MOURNING DOVES

This is a report of parasites of the Mourning Dove as reported by Dr. B. L. Owen, of the USDA, Florence, South Carolina, in collaboration with the writer as reported in the Texas Journal of Science, Vol. X:4, 1958.

It is to be recognized that birds have many kinds of parasites. The particular kind of parasite reported here is a type of mite that lives in the nasal cavity. This mite is especially found in the Mourning Dove and has been named, *Neonyssus zenaidurae* Crossley.

The doves in this study were collected by the writer from sportsmen. Ten were collected near Comer in Barbour County, Alabama, and 34 from near Bay Minette and Foley, Baldwin County, Alabama, through the help of Mr. Charles Kelley of the Alabama Department of Conservation. All of these were collected in October, 1957.

Dr. Owen examined the doves for mites by opening the nasal cavity with a scalpel and then, by use of a microscope, locating the mites and removing them with dissecting needles. He recorded 40 per cent of the doves from near Comer infested with a mean of 1.5 mites per dove and that 29.4 per cent of the doves from Baldwin County, were infested with a mean of 2.6 mites per dove. These are the first mites taken from the doves in Alabama.
